

## Appendix 9A

## **Glossary of Acoustic Terminology**

ambient noise	The totally encompassing sound in a given situation at a given time, usually composed of sound from many sources, near and far.
background noise	The steady existing noise level present without contribution from any intermittent sources. The A-weighted sound pressure level of the residual noise at the assessment position that is exceeded for 90 per cent of a given time interval, T ( $L_{AF90,T}$ ).
broadband	Sounds that contain energy distributed across a wide range of frequencies.
dB	Decibel - The scale in which sound pressure level is expressed. It is defined as 20 times the logarithm of the ratio between the RMS pressure of the sound field and the reference pressure of 20 micro-pascals (20 $\mu$ Pa).
dB L <sub>pA</sub>	An 'A-weighted decibel' - a measure of the overall noise level of sound across the audible frequency range (20 Hz – 20 kHz) with A-frequency weighting (i.e. 'A'-weighting) to compensate for the varying sensitivity of the human ear to sound at different frequencies.
Hertz (Hz)	The unit of sound frequency in cycles per second.
L <sub>Aeq,T</sub>	This is the equivalent continuous sound level. It is a type of average and is used to describe a fluctuating noise in terms of a single noise level over the sample period (T).
L <sub>AFN</sub>	The A-weighted noise level exceeded for N% of the sampling interval. Measured using the "Fast" time weighting.
L <sub>AFmax</sub>	is the instantaneous slow time weighted maximum sound level measured during the sample period (usually referred to in relation to construction noise levels).
L <sub>AF90</sub>	Refers to those A-weighted noise levels in the lower 90 percentile of the sampling interval; it is the level which is exceeded for 90% of the measurement period. It will therefore exclude the intermittent features of traffic and is used to estimate a background level. Measured using the "Fast" time weighting.
noise	Any sound, that has the potential to cause disturbance, discomfort or psychological stress to a person exposed to it, or any sound that could cause actual physiological harm to a person exposed to it, or physical damage to any structure exposed to it, is known as noise.

noise sensitive receptor NSR – Any dwelling house, hotel or hostel, health building, educational establishment, place of worship or entertainment, or any other facility or

other area of high amenity which for its proper enjoyment requires the absence of noise at nuisance levels.

octave band A frequency interval, the upper limit of which is twice that of the lower limit. For example, the 1,000Hz octave band contains acoustical energy between 707Hz and 1,414Hz. The centre frequencies used for the designation of octave bands are defined in ISO and ANSI standards.

sound power level The logarithmic measure of sound power in comparison to a referenced sound intensity level of one picowatt (1 pW) per m<sup>2</sup> where:

$$Lw = 10 Log \frac{P}{P_0} dB$$

Where: p is the rms value of sound power in pascals; and P<sub>0</sub> is 1 pW.

sound pressure level The sound pressure level at a point is defined as:

$$Lp = 20Log \frac{P}{P_0}$$
 dB

1/3 octave analysis Frequency analysis of sound such that the frequency spectrum is subdivided into bands of one-third of an octave each.
